

ROTARY DISC MOWER

- It is the most appropriate machine used to cut feed plants growing aslope such as common vetch, white clover, bird-foot deervetch and any meadow, pasturage and weeds by the impact of air flow occurring by turning of discs.
- It has safety mechanism in order to prevent the damages to occur during hitting hard and large objects (tree, stone etc.).
- It is made appropriate to slope through a hydraulic piston in sloping land.
- The grasses cut are provided to be collected at desired width by a router inserted behind the machine.
- It spreads the grasses cut by high cutting quality as uniform stalk is left. By this means, high speed drying is performed by protecting plant nutrition values.
- It provides performing quite low and quality cutting in graded field.

MODEL	Number of discs (PIECE)	Working width (MM)	Transport width (MM)	Overall height (MM)	Number of Blades (PIECE)	Optimal Working speed	Capacity (da/h)	P.T.O. Shaft Rotations (Max.)(Min-1)	Weight (KG)	Power requirement (HP)
